# Elements

By: Hector Nunez

Introduction

This digital zine I made is actually a collection of the art I managed to create when I first learned Adobe Photoshop and Adobe Illustrator. I would take images and using a spark of my creativity I would add into them and transform them into images that look unreal. Some images here were created from other images as I took inspiration and others were solely created by me from scratch.

The first few artworks I'll present are a galaxy in the silhouette of a model that I titled, "Galaxy Girl" and a remix of the same work with a background, unlike the first one, where I myself created the background. On the next page, my Alter Ego portrait is located, where I have everything I like in one picture as a collage. The artwork after that actually seems like an original, but it's actually a dark landscape with pixels reduced and recolored to outstand from the rest of dark landscapes. The HEX Logo is something unique I created in Adobe Illustrator and below it is a face I also created in illustrator while exploring options and thought of posting it here.

This was my first take on the Galaxy Girl art work I managed to create in Adobe Photoshop. I made the background with those colors in order to match the nice picture in the middle. I used a model's silhouette and inserted the galaxy picture inside. I also added yellow dots to make the picture pop out. I used the eyedrop tool to get the shade of purple that's in the galaxy picture within the girl.

This was my second version of the Galaxy Girl art work where I took a background and put it behind the girl's silhouette. I wanted to use my creativity in this piece by making it seem like the man in the inner picture (who is looking at the galaxy) is also looking at the mountains. (Also made with Photoshop).
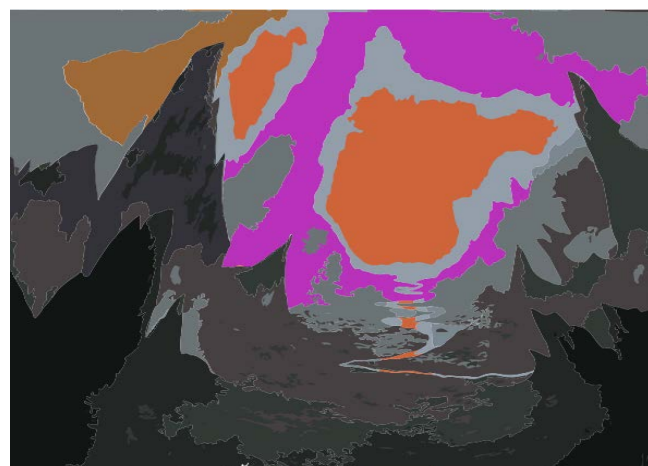

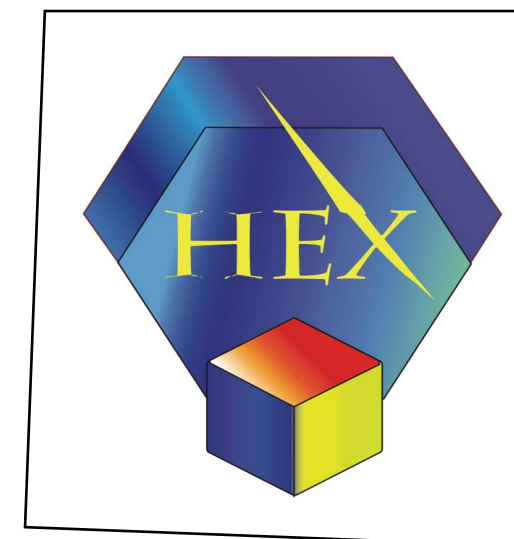

This is an Alter Ego Collage and also my second photoshop project where I had to combine a few things that represent my alter ego (my other self) and things that I love. I used to read Marvel comics and watch the cartoons, I play video games a lot with my Playstation 4 and Nintendo Switch. I also like the colors red and purple. My favorite anime is Dragonball Z and favorite Marvel hero is Spider Man.

Made with Adobe Photoshop

This is one of my proudest works because I made it entirely from scratch. This idea came straight out of my mind, the picture above is a custom logo I call the 'HEX Logo'. I used Adobe illustrator to create the hexagons and also created my custom font when I changed the way the letters look, hence why the 'X' has a slash going through it. The cube in the middle is even a hexagon itself with the angle of looking like a cube.
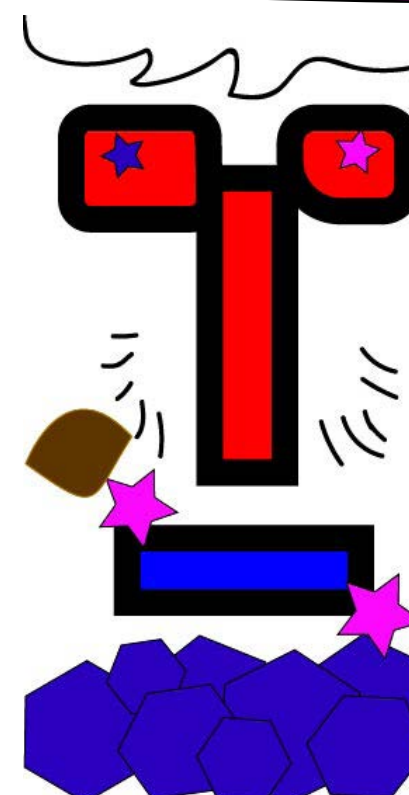

This work was a fun little side project where I just colored in a dark landscape (a cavern) with odd colors. I reduced the pixels in the landscape and painted most of it so it can seem really odd in a sense and makes you think "this looks really weird and

Made with Adobe Illustrator

This is my first ever work in Adobe Illustrator.
As I thinking of what to make, I decided to use shapes to create a face. This work is just called 'Face' because, well, I thought it seemed obvious. I used a bunch of hexagons for a beard, the blue rectangle as the mouth and the top lines were created as an unusual hair line (created with the pen tool). The stars were for a bonus efffect, The little whiskers on the side is supposed to be a moustache along with the nose and eyes at the top. To be honest, that brown spot was just a random addition and I really don't know why I put it there haha.
